B. Amendment to the Claims:

Please amend claims 1 and 2 as follows.

- 1. (Currently Amended) A method for identifying an unknown base sequence present in a target single-stranded nucleic acid comprising the steps of:
- (a) preparing a probe array in which single-stranded nucleic acid probes of
 No. 1 to No. n (n≥2) are arranged as isolated spots on a substrate, the probes each having a
 base sequence complementary to one of plural base sequences expected to be the unknown
 base sequence;
- (b) reacting a single-stranded nucleic acid, which has a base sequence fully complementary to a base sequence of one of the single-stranded nucleic acid probes and is fluorescence-labeled, with the probe array under such conditions that single-stranded nucleic acids complementary to each other form a double-stranded nucleic acid;

removing the unreacted labeled single-stranded nucleic acid;; and
measuring fluorescence intensity of each spot of the probe array to obtain a
first image template pattern showing a relationship between location of the probes and
fluorescent characteristics;

(c) performing the same operation as the step (b) for each of remaining single-stranded nucleic acid probes using a second to a nth single-stranded nucleic acid, and obtaining <u>image</u> template patterns of No. 2 to No. n showing a relationship between location and fluorescent characteristics of the probes;

- (d) performing the same operation as the step (b) using a sample containing the target single-stranded nucleic acid of <u>the</u> unknown base sequence to obtain a sample pattern showing <u>a</u> relationship between a position and fluorescent characteristics; and
- (e) comparing the sample pattern obtained in the step (d) with n pieces of said image template patterns obtained in the steps (b) and (c), to identify an image template pattern showing substantially the same pattern as the sample pattern and identifying the base sequence of the single-stranded nucleic acid used for the preparation of the identified image template pattern as the unknown base sequence of the target single-stranded nucleic acid.
- 2. (Currently Amended) A method for identifying an unknown base sequence present in a target single-stranded nucleic acid comprising the steps of:
- (a) preparing a probe array in which single-stranded nucleic acid probes of No. 1 to No. n (n≥2) are arranged as isolated spots on a substrate, the probes each having a base sequence complementary to one of plural base sequences expected to be the unknown base sequence;
- (b) reacting a single-stranded nucleic acid which has a base sequence fully complementary to a base sequence of one of the single-stranded nucleic acid probes and is fluorescence-labeled, with the probe array under such conditions that single-stranded nucleic acids complementary to each other form a double-stranded nucleic acid;

removing the unreacted labeled single-stranded nucleic acid;; and

measuring fluorescence intensity of each spot of the probe array to obtain a first template pattern showing a relationship between location of the probes and fluorescent characteristics;

- (c) analyzing the first template pattern to locate probes and to calculate a mean value of fluorescence intensities (Fi) of the double-stranded nucleic acids having i of mismatched base pairs, where i is an integer not less than 1;
- (d) calculating a difference (F1, 0) between the fluorescence intensity of the fully complementary double-stranded nucleic acid without mismatch (F0) and the mean value of the fluorescence intensities of the double-stranded nucleic acids having one-base mismatch (F1), further calculating a difference (Fi+1, i) between a fluorescence intensity of a double-stranded nucleic acid having (i+1) base mismatches (Fi+1) and a fluorescence intensity of a double-stranded nucleic acid having i-base mismatches (Fi), and identifying i being Fi+1, i << Fi, i-1;
- (e) preparing a second template pattern of positive probe spots of probes having base sequences differing from the base sequence of the second probe by i or less bases where i is determined in said step (d), wherein negative probe spots are probes having base sequences differing from the second probe by more than i bases assuming a target DNA which base sequence is complementary to the second probe sequence, then obtaining the second template pattern formed by the probe position where the number of mismatched base pairs to the target having the complementary sequence to the second probe sequence is not more than i;
- (f) performing the same operation as the step (e) for each of remaining single-stranded nucleic acid probes using a third to a nth single-stranded nucleic acid, and

obtaining template patterns of No. 3 to No. n showing a relationship between location and fluorescent characteristics of the probes, wherein the template patterns are formed from the positions of the probes having a base sequence that forms mismatched base pairs in a number not more than i;

- (g) performing the same operation as the step (b) using a sample containing the target single-stranded nucleic acid of unknown base sequence to obtain a sample pattern showing <u>a</u> relationship between a position and fluorescent characteristics; and
- (h) comparing the sample pattern obtained in the step (g) with n pieces of template patterns obtained in the steps (b), (c) and (e); to identifying a template pattern showing essentially the same pattern as the sample pattern; and determining identifying the base sequence of the target single-stranded nucleic acid to be a base sequence complementary to the base sequence of the probe taken used for the preparation of the identified template pattern as the unknown base sequence of the target single-stranded nucleic acid.
- 3. (Original) The method according to claim 2, wherein the step (g) further comprises the substep of obtaining a two-valued pattern of the fluorescence intensity by using the threshold fluorescence intensity Fi.
- 4. (Original) The method according to claim 2, wherein the length of the probe is 8 mer to 30 mer.

- 5. (Original) The method according to claim 4, wherein the length of the probe is 12 mer to 25 mer.
- 6. (Original) The method according to claim 2, wherein the number of the mismatched base pairs (i) is 1.
 - 7-8. (Cancelled).
